English: B1 (Intermediate, CEFR)
Work setup: remote (preferred), hybrid, office; open to relocation and business trips

Data Analyst

Data analyst: 1.5 years on a trading-bot team — ClickHouse and PostgreSQL, 35 Grafana panels, market analysis and hypothesis testing. My conclusions changed decisions about people and money: I made the case for moving two teams onto one product and found survivorship bias in the strategy estimate. I combined analytics with leading a team of up to 5, so I understand the business task and explain conclusions clearly.

Experience (1 year 6 months in data analytics; 1 year 8 months working with geodata)

04.2025 — 09.2026 | **Data Analyst and Team Lead, BCH Labs, remote**
Trading bot on the Solana blockchain. Data: transaction stream and months of trading history, millions of rows per epoch; ClickHouse (sharded cluster), PostgreSQL. Reported to the founder; led a team of up to 5 (Rust developer, ML engineers, DevOps): hiring, roadmap, prioritisation, dailies and retros.

Choosing the product to focus the team on (2026)
With limited funding, decide which of two bots the team should invest in.
— Compared the arbitrage and copy-trading bots on trading-session PnL, team costs and market analysis: arbitrage was stuck in a millisecond race, copy trading was not
Result: merged two teams into one; team costs down, runway up, verified live-session results within a month

Historical data storage and marts (2025—2026)
— Owned table structure, loading of raw transactions into event tables and backfilling of missing periods; wrote migrations and DDL
— Found a 6% loss of events by reconciling keys against the source table (anti-join) and documented the parser cause

Dashboards and monitoring in Grafana (2025—2026)
— Built and maintained three SQL-based dashboards: trading session analysis (15 panels), trading simulation (10), market health (10)
— Replaced five conflicting profit metrics with one — net cash flow; median instead of mean, minimum sample-size threshold

Memecoin market analysis (2026)
Estimate the market size and the bot's earning ceiling for a funding decision.
— Collected a year of market data from an independent source (Dune): 30k new tokens, 213k buyers and 882 listings per day (2.9%)
— Recalculated model recall on the true denominator (0.45% instead of 2%) and the bot's unit economics with a break-even point
Result: the funding decision relied on verified numbers; the July 2025 market drop = users moving to a competitor

User classification and hypothesis testing (2026)
Find wallets whose trades are worth copying and test what would raise the bot's returns.
— Built a 12-step SQL pipeline: per-token profit, bot detection, statistics, classification, threshold filters, transfer graph
— Found a false positive in the bot rule and recovered 163 strong traders (+14%); took part in training LightGBM models
— Ran an A/B/C/D experiment on execution parameters and a forward test over 9 sessions (~780 trades)
— Found survivorship bias in the strategy estimate: +27% on closed trades vs −1.8% across all buys
Result: external REST API cross-check — 0.5% mismatch; four growth hypotheses were closed before any development spend

08.2023 — 04.2025 · **Cartographer-Editor, cartographic enterprise, Minsk** — *mandatory placement: geodata, accuracy and consistency control, proofreading*
09.2022 — 06.2023 · **Lecturer in Cartography; Academic Process Specialist, Belarusian State University, Minsk** — *cartography classes and academic process support; research on population density mapping of Belarus*

Other experience (details in the portfolio): *11.2023 — 04.2025 business assistant to the founder of ETICO.BY; 09.2016 — 11.2019 assistant to the head of CT-EXPRESS online school.*

Pet project

SQL analysis of the Olist marketplace (2026, in progress)
Real data from a Brazilian marketplace: ~100k orders, 9 related tables. PostgreSQL, all SQL written by hand.
— A late delivery lowers the review score by 2 points out of 5; lateness is driven by the regional delivery-promise buffer, not distance
— Found that one cart is split into several orders: the true repeat rate is 2.85%, not 3.1%; a late first order reduces repeat purchases by about 18%
— Showed how JOIN fan-out distorts metrics: revenue inflated by 4–34%, a list of 'bad' sellers of 6 instead of 2

Education

2017 — 2023 | **Belarusian State University, Minsk**
Faculty of Geography and Geoinformatics, Department of Geodesy and Aerospace Cartography
Cartography and geodesy, specialist degree; MSc in Geographical Sciences
Research on population density mapping of Belarus. Chair of the housing committee of the faculty trade union: paperwork, database, student accommodation.
July 2026 | **BELHARD Education Center** — «Data Analyst from Scratch»: SQL and window functions, statistics and A/B tests, Python, BI dashboards

Certificates

July 2026 | Certificate of completion, «Data Analyst from Scratch», BELHARD Education Center

Skills

SQL: PostgreSQL and ClickHouse: JOINs and anti-joins, subqueries, EXISTS, CTEs, window functions (ROW_NUMBER, RANK, LAG, running totals), query optimisation, migrations and DDL
Data: warehouse and data marts, ETL: reparsing and backfilling history, REST APIs, Dune; data-quality checks — duplicates, keys, gaps
Metrics: repeat rate, retention, conversions and shares with the right denominator, median vs mean, survivorship bias
BI: Grafana — three dashboards, 35 SQL panels, configuration via API
Python and AI: pandas, numpy, LightGBM; code with Claude Code and Cursor: I set requirements and verify the result
Statistics: A/B tests (BELHARD course); in practice — an A/B/C/D test, a forward test, a permutation test
Engineering: Rust — basic, contributions to production code; Git, Docker, Linux, Notion
