English: B1 (Intermediate, CEFR)
Work setup: remote (preferred), hybrid, office; open to business trips

Product Analyst

Product analyst: 1.5 years of the full analytics cycle in a startup — product metrics, A/B testing, unit economics. SQL (window functions, CTEs) in ClickHouse and PostgreSQL, dashboards in Grafana. Built a break-even model and closed four revenue-growth hypotheses with an A/B/C/D test before any development spend. Led a team of up to 5.

Experience (1 year 6 months in data analytics; 1 year 8 months working with geodata)

04.2025 — 09.2026 | **Data Analyst and Team Lead, BCH Labs, remote**
Product: a trading bot on the Solana blockchain; data: a stream of traders' transactions, millions of rows. Reported to the founder; led a team of up to 5: roadmap, prioritisation, hiring.

Unit economics and break-even point (2026)
Find the model accuracy at which the product pays off and set the target for the next stage.

— Broke profit down into drivers: result of a single trade, probability of success, model accuracy
— Built a trade-result calculator from the exchange pricing formula and the price-growth distribution of ~2M assets over 2.5 months, reconciled with an independent source
— Built a financial model: break-even point for each sell target against model accuracy (60%)
Result: the «easy» targets proved unprofitable (doubling the price required being right 86% of the time); only one strategy paid off, and the bot covered about half of the team's costs — the next stage's goal was set in these metrics

Experiments and hypothesis testing (2025—2026)
Find what would raise the product's returns without spending months of development on guesses.

— Broke the loss down: a quarter from price drops, three quarters from capital locked in unsold assets
— Designed and analysed experiments in two stages — simulation on history, then paper trading on the live market: exit rule and stop-loss, 8 exit variants against the baseline, execution speed (A/B/C/D)
— Found survivorship bias in the strategy estimate: +27% on closed trades vs −1.8% across all buys
Result: no stop-loss added: −30% per trade vs −1.8% for the baseline exit; execution delay cut threefold, while the median overpayment stayed ~60%; four hypotheses closed before development spend, focus moved to trade entry

User segmentation (2026)
Find traders whose trades are worth following.

— Built a 12-step SQL pipeline: per-user profit, signs of automated trading, classification; found a false «bot» rule and returned 163 strong traders to the segment (+14%)
Result: in the next period the strong segment made money, the regular one stayed around zero and the suspicious one went negative; cross-check with an external service — 0.5% mismatch

Market metrics and the funding decision (2026)
Estimate the market size and the product's earning ceiling.

— Collected a year of market data (Dune) and built a market-health dashboard: 30k new assets and 213k buyers per day
— Recalculated the model metric on the true denominator (0.45% instead of 2%) and fixed my own metric that gave 103.5% on history
Result: the market drop was users moving to a competitor, not a data failure; funding was decided on verified numbers, and the team added the competitor's platform

08.2023 — 04.2025 · **Cartographer-Editor, cartographic enterprise, Minsk** — *mandatory placement after graduation; remote assistant projects in parallel: geodata, accuracy control, proofreading before release*
09.2022 — 06.2023 · **Lecturer in Cartography; Academic Process Specialist, Belarusian State University, Minsk** — *cartography classes and academic process support; research on population density mapping of Belarus*

Other experience (details in the portfolio): *11.2023 — 04.2025 business assistant to the founder of ETICO.BY (remote, alongside the placement); 09.2016 — 11.2019 assistant to the head of CT-EXPRESS online school.*

Pet project

Product analysis of the Olist marketplace (2026, in progress)
Real data from a Brazilian marketplace: ~100k orders, 9 related tables. PostgreSQL, all SQL written by hand; write-up in the portfolio.

— A late delivery lowers the review score by 2 points out of 5 and repeat purchases by ~18%; the true repeat rate is 2.85%, not 3.1%: one cart is split into several orders
— Showed how JOIN fan-out distorts metrics: revenue was inflated by 4–34%

Education

2017 — 2023 | **Belarusian State University, Minsk**
Faculty of Geography and Geoinformatics, Department of Geodesy and Aerospace Cartography
Cartography and geodesy, specialist degree; MSc in Geographical Sciences
Research on population density mapping of Belarus. Chair of the housing committee of the faculty trade union: paperwork, database, student accommodation.
2026 | **BELHARD Education Center** — «Data Analyst from Scratch»: SQL and window functions, statistics and A/B tests, Python, BI dashboards

Skills

Product metrics: conversion and funnel analysis, retention and cohort analysis, repeat rate, unit economics and break-even point, shares with the right denominator, median vs mean
A/B testing and statistics: A/B/C/D test and forward test in practice; MDE, SRM, guardrail metrics; p-value, confidence intervals, type I and II errors
SQL, data and BI: window functions, CTEs, anti-joins; PostgreSQL, ClickHouse; data marts, ETL; Grafana — 3 dashboards, 35 panels
Python and AI: pandas, numpy — basic; AI tools (Claude Code, Cursor) with verification of the result
