English: B1 (Intermediate, CEFR)
Work setup: remote (preferred), hybrid, office; open to relocation and business trips

Data Analyst

For a year and a half I computed metrics and tested hypotheses for a trading-bot team: SQL in ClickHouse and PostgreSQL, data marts, dashboards. I am good at spotting where numbers lie — duplicates, double counting, a wrong metric definition. Before analytics I spent seven years in project management and operations, so I quickly see what the business actually needs.

Experience (1 year 6 months in data analytics; 1 year 8 months working with geodata; 7 years 1 month total)

03.2025 — 09.2026 | **Data Analyst and Project Manager, BCH Labs, remote**
Trading bot on the Solana blockchain. Data: on-chain event stream and months of trading history; ClickHouse (sharded cluster) and PostgreSQL. Team of up to 5: DevOps, ML engineer, Rust developers.

Historical data storage and marts (2025—2026)
The base on which features, backtests and market metrics are computed.

— Owned table structure, reparsing of raw transactions into events, and backfilling of missing periods by epoch
— Wrote migrations and DDL for ClickHouse: feature tables, wallet labels, market metrics; ReplacingMergeTree and Distributed tables
— Found a methodological error in a release metric that reported 103.5% and replaced the data source
Result: the team got a single historical base where features and backtests are reproducible

Dashboards and monitoring in Grafana (2025—2026)
The team had to see results and market health without manual exports.

— Built and maintained three dashboards: trading session analysis (15 panels), paper trading (10), market health (10)
— All 35 panels compute metrics as database queries — filtering and aggregation in SQL, not in application code; configuration via the Grafana API
Result: PnL, slippage and market metrics became available to the team in real time, with no manual exports

Wallet classifier and ML models (2026)
Identify wallets in the on-chain event stream whose trades are worth copying.

— Built a 12-step SQL pipeline in ClickHouse: per-token PnL, round-trip bot detection, wallet statistics, classification, gates, transfer graph
— Designed features on realised PnL: win rate, profit factor, a composite skill score
— Trained four LightGBM model versions with cross-validation and probability calibration; evaluation via ROC-AUC and precision-recall
— Ran an A/B/C/D experiment on execution parameters and a forward test over 9 sessions (~780 round trips)
Result: cross-checking labels through an external REST API showed only 0.5% false positives; four growth hypotheses were closed quantitatively

08.2023 — 04.2025 | **Cartographer-Editor, cartographic enterprise, Minsk**
Mandatory work placement after graduation; ran assistant projects in parallel.

— Edited cartographic products: geodata handling, accuracy and consistency control, proofreading before release

09.2022 — 06.2023 | **Lecturer in Cartography; Academic Process Specialist, Belarusian State University, Minsk**
Cartography classes and academic process support; research on population density mapping of Belarus.

Other experience (details in the portfolio): *03.2024 — 08.2025 technical assistant for psychology groups; 11.2023 — 04.2025 business assistant to the founder of ETICO.BY; 07.2023 — 11.2023 content assistant in an info-business project; 09.2016 — 11.2019 assistant to the head of CT-EXPRESS online school.*

Pet project

SQL analysis of the Olist marketplace (2026, in progress)
Real data from a Brazilian marketplace: ~100k orders, 9 related tables. PostgreSQL, all SQL written by hand.

— Designed the schema with keys and found data-quality issues: non-unique review IDs, an incomplete category dictionary, delivered orders without a delivery date
— Showed that a late delivery lowers the review score by 2 points out of 5, and that lateness is driven by the regional delivery-promise buffer, not by distance
— Found that one cart is split into several orders: the true repeat rate is 2.85%, not 3.1%; a late first order reduces repeat purchases by about 18%
— Showed how JOIN fan-out distorts metrics: revenue inflated by 4–34%, a list of 'bad' sellers of 6 instead of 2

Education

2017 — 2023 | **Belarusian State University, Minsk**
Faculty of Geography and Geoinformatics, Department of Geodesy and Aerospace Cartography
Cartography and geodesy, specialist degree; MSc in Geographical Sciences
Research on population density mapping of Belarus. Chair of the housing committee of the faculty trade union: paperwork, database, student accommodation.

July 2026 | **BELHARD Education Center** — «Data Analyst from Scratch»: SQL and window functions, statistics and A/B tests, Python, BI dashboards

Certificates

July 2026 | Certificate of completion, «Data Analyst from Scratch», BELHARD Education Center

Skills

SQL: PostgreSQL and ClickHouse: JOINs and anti-joins, subqueries, EXISTS, CTEs, window functions (ROW_NUMBER, RANK, LAG, running totals), query optimisation, migrations and DDL
Data: warehouse and data marts, ETL: reparsing and backfilling history, REST APIs; data-quality checks — duplicates, keys, gaps, export cut-off
Metrics: repeat rate, retention, conversions and shares with the right denominator, median vs mean, survivorship bias
BI: Grafana — three dashboards, 35 SQL panels, configuration via API
Python: pandas, numpy, LightGBM — working together with AI assistants (Claude, Cursor)
Statistics: hypothesis testing and A/B tests: BELHARD course; in practice — an A/B/C/D test of execution parameters
Engineering: Rust — basic, contributions to production code; Git, Docker, Linux, Notion
